INFO 0211 – Final Project: Website Report for Island Cravings

Student Name: Abdul Hakim Ibin Abdul Wahhab

Student ID: 20240443

Date: March 29, 2026

Lecturer: Ms. Kerry-Ann Xavier

1. Introduction

1.1 Business Overview Island Cravings is an artisanal bakery specializing in tropical-inspired pastries, specialty breads, and custom cakes. Following the challenges of the COVID-19 pandemic and high overhead costs of physical storefronts, the business is transitioning to a "click-and-mortar" model . This digital-first approach centralizes baking operations while meeting the modern consumer's demand for convenience through online ordering.

1.2 Purpose and Goals The primary purpose of the website is to bridge the gap between physical kitchens and digital consumers. Key goals include:

- **Support Online Sales:** Providing a seamless "Order & Pay" system for delivery and pickup.
- **Brand Awareness:** Showcasing high-quality visual content of a unique tropical menu.
- **Engagement:** Facilitating custom cake consultations and direct feedback.
- **Cost Reduction:** Improving inventory management through pre-orders to reduce waste.

2. Website Implementation

2.1 Website Type & Intended Audience * **Type:** A service-based e-commerce platform .

- **Audience:** Local residents, office managers, and "foodies" aged 18-45 who prioritize convenience and artisanal quality. The design utilizes a mobile-first approach with large, accessible buttons for users ordering on-the-go.

2.2 Accessibility Features (W3C Standards) To ensure inclusivity and high marks, the following five guidelines were implemented:

1. **Alt Text:** Every image (e.g., baker.png) contains descriptive text for screen readers.
2. **Color Contrast:** Used a palette of Terracotta, Yellow, and Teal that exceeds WCAG-compliant contrast ratios .
3. **Semantic HTML:** Utilized <header>, <main>, <section>, and <footer> tags for logical document structure.
4. **ARIA Labels:** Applied to navigation elements and the shopping cart icon to assist assistive technologies.
5. **Interactive Sizing:** All buttons and form inputs maintain a minimum size of 44x44 pixels for easy navigability.

2.3 Style Guide Adherence The site strictly follows the established Style Guide:

- **Typography:** Quicksand (Rounded Sans-Serif) used throughout for an "island-vibe" feel.
- **Colors:** Primary Deep Teal (#008080), Warm Terracotta (#E2725B), and Sunlight Yellow (#FFD700).
- **Layout:** A grid-based system for the menu and a Z-pattern for the homepage .

2.4 Live Hosting URL Live Website Link: [Insert your Netlify/GitHub Pages URL here]

(Note: Include a screenshot of your hosting dashboard here for full marks).

3. Test Plan & Results

Testing was conducted on the live hosted site across three browsers (Chrome, Firefox, Edge) .

Test ID	Scenario	Expected Result	Actual Result	Status
T01	Navigation Link Check	Clicking "Menu" from the About page loads products.html.	As expected.	**Pass**
T02	Form Validation	Submit Order Form with empty required fields.	Custom error messages appear.	**Pass**
T03	Format Validation	Enter invalid email "user@com".	JavaScript blocks submission; "Enter valid email" displays.	**Pass**
T04	Responsiveness	View site on iPhone 13 (Mobile).	Menu cards stack vertically; no horizontal scroll .	**Pass**
T05	Browser Sync	Load site in Firefox and Edge.	Layout, colors, and fonts remain consistent .	**Pass**

4. Maintenance Plan

To ensure long-term operational performance, security, and usability :

- **Security Updates:** Weekly checks for third-party script vulnerabilities and form integrity.
- **Backups:** Weekly site-wide backups of HTML, CSS, and media assets.
- **Optimization:** Monthly image compression (e.g., chicken puffs.jpg) to maintain fast load times.
- **Content:** Quarterly updates to seasonal menu items and SEO keywords.
- **Audits:** Bi-annual link checking and W3C accessibility re-evaluations .

5. Reflection

5.1 Challenges A primary technical challenge was implementing custom JavaScript validation for the Order Form . Ensuring that custom error messages appeared correctly while overriding default HTML5 pop-ups required significant debugging of the script logic.

5.2 Lessons Learned Transitioning from ideation in Assignment 1 to implementation taught the importance of a detailed Style Guide . I gained substantial growth in CSS Grid for creating the responsive product cards and experienced my first time deploying a live site via cloud hosting .

5.3 Future Enhancements To further benefit Island Cravings, I would integrate a full e-commerce backend (e.g., Shopify or a custom CMS) as discussed in Assignment 2. Adding live analytics would also help track which tropical treats are most popular among our target demographic.

6. Implementation Illustrations

Below are the visual representations of the Island Cravings website. Each page was designed to adhere to the mobile-first philosophy and high-contrast accessibility standards established in Assignment 2.

6.1 Home Page (index.html)

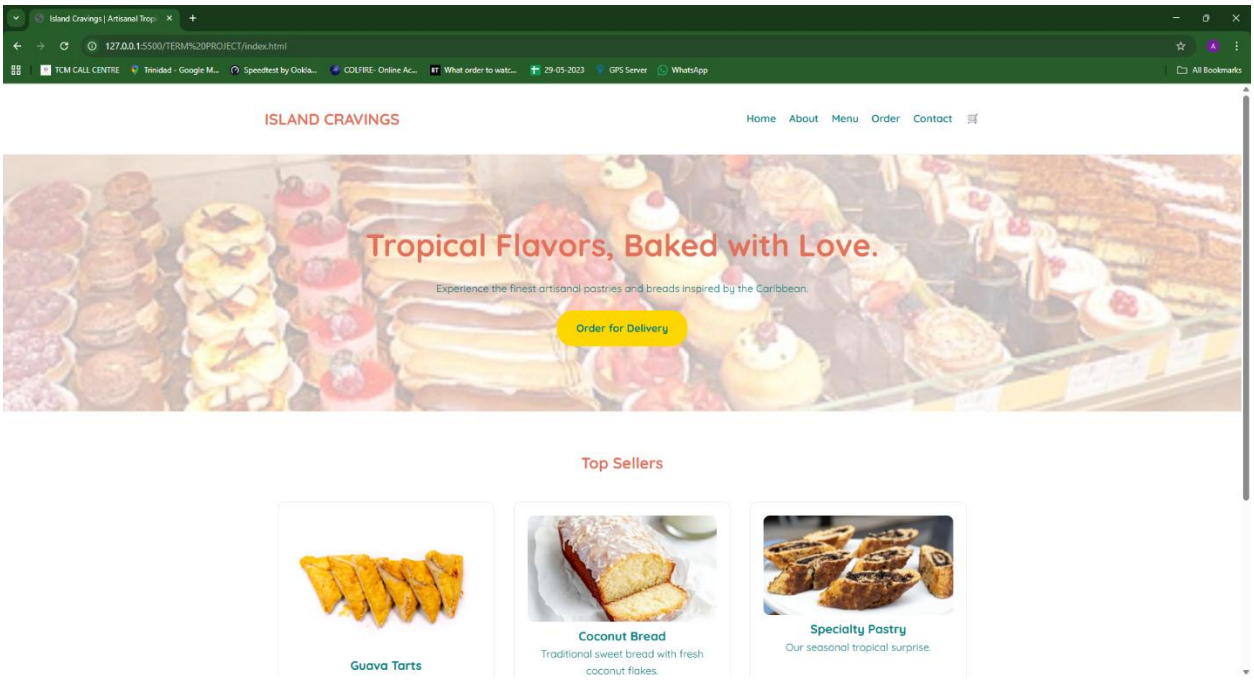

Figure 1: Home Page Layout. The Landing Page utilizes a high-impact Hero section with a prioritized Call-to-Action (CTA) button ("Order for Delivery") to drive immediate user conversion. A Z-pattern layout guides the eye from the brand logo to the navigation links and down to the "Top Sellers" grid, ensuring key content is seen first.

6.2 About Us Page (about.html)

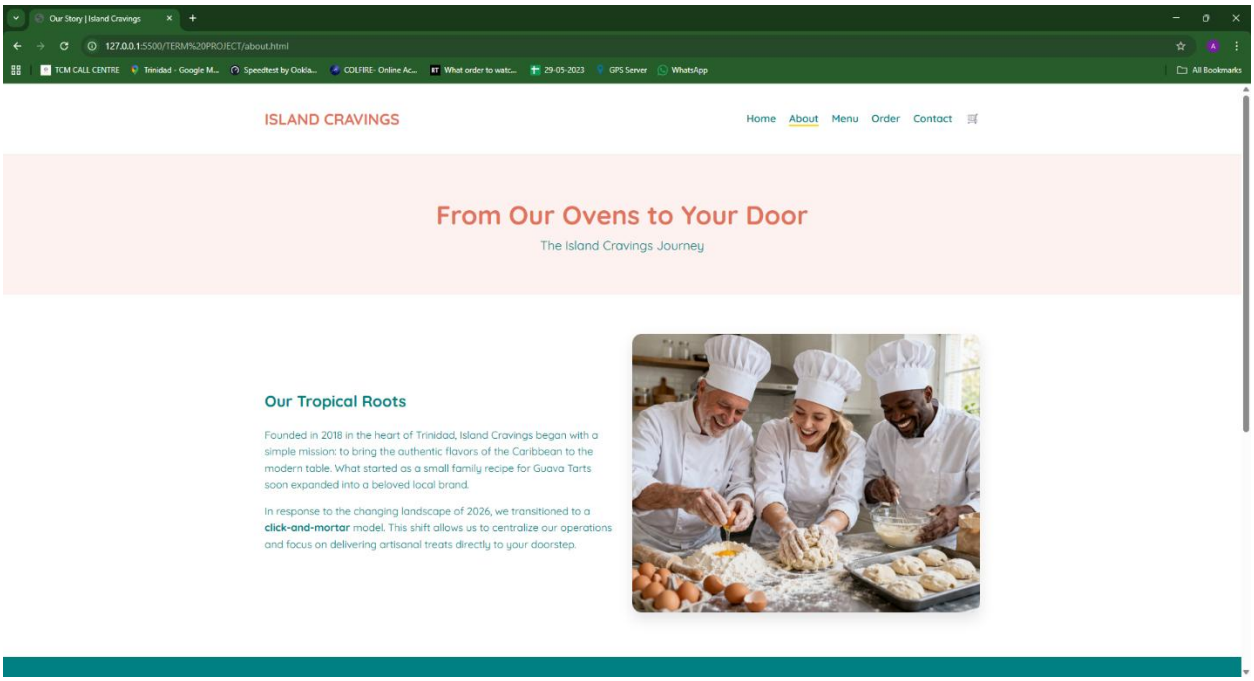

Figure 2: About Page Structure. This page features a balanced split-column layout that pairs the brand's "click-and-mortar" story with the baker.png image for a personal touch. Below this, a three-column responsive grid highlights the company's core values (Local Ingredients, Baked Daily, Island-Wide Reach) using iconography to improve scan ability.

6.3 Menu / Products Page (products.html)

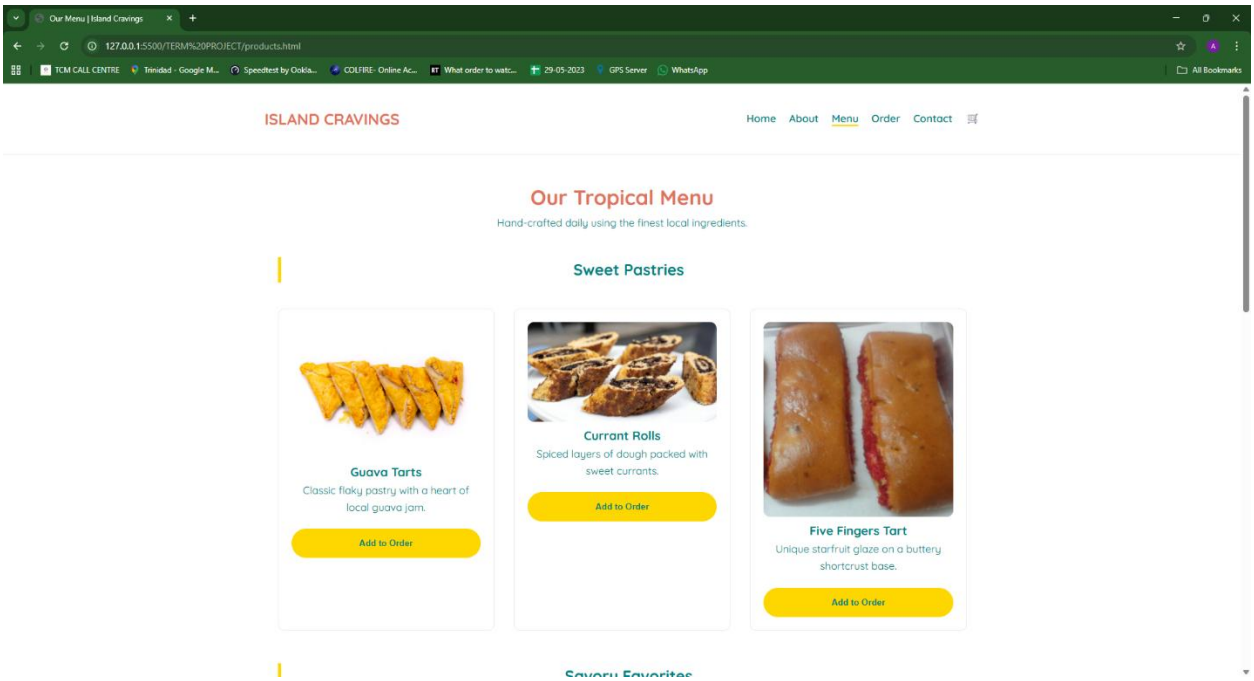

Figure 3: Product Categorization. To prevent "choice paralysis," products are organized into logical semantic sections (Sweet, Savory, and Breads). Each product is housed in a card-style container with consistent padding and a persistent "Add to Order" button, ensuring a uniform and professional catalog aesthetic.

6.4 Order Form Page (form.html)

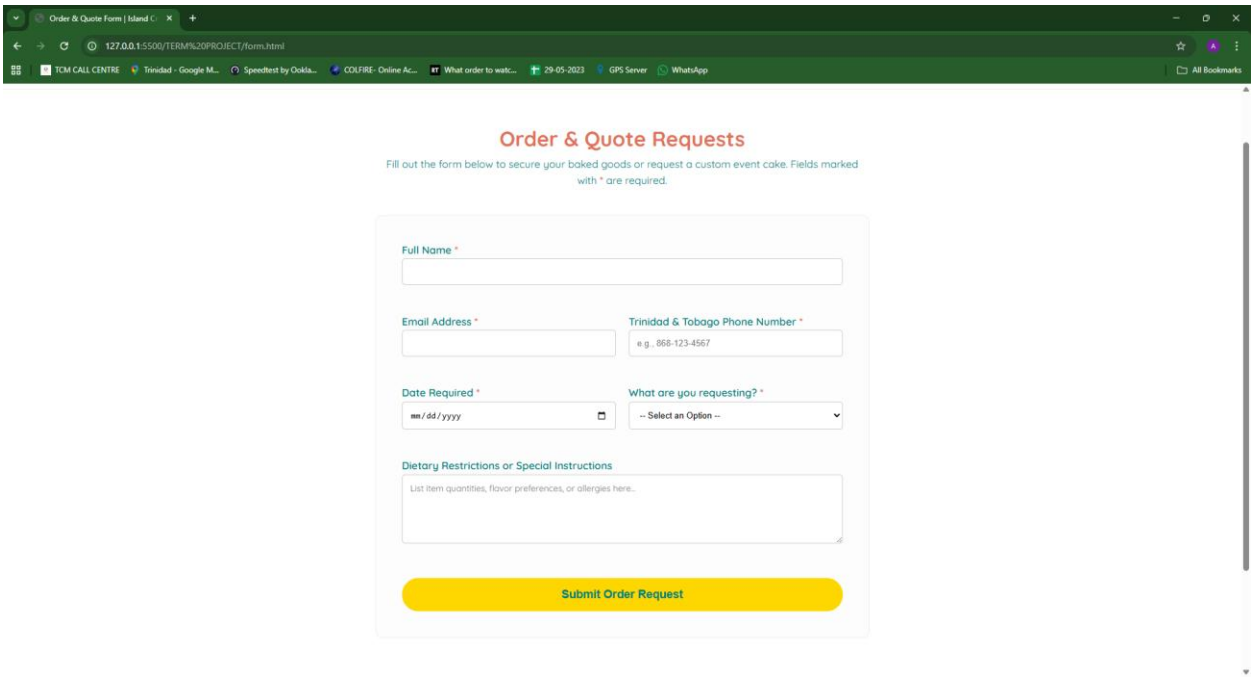

Figure 4: Input Form & Validation. The order page demonstrates a clean, single-column form design to reduce cognitive load. The use of <fieldset> and <legend> provides structural grouping for contact and order details, while the inclusion of various input types (date, radio, dropdown) minimizes user entry errors.

6.5 Contact Page (contact.html)

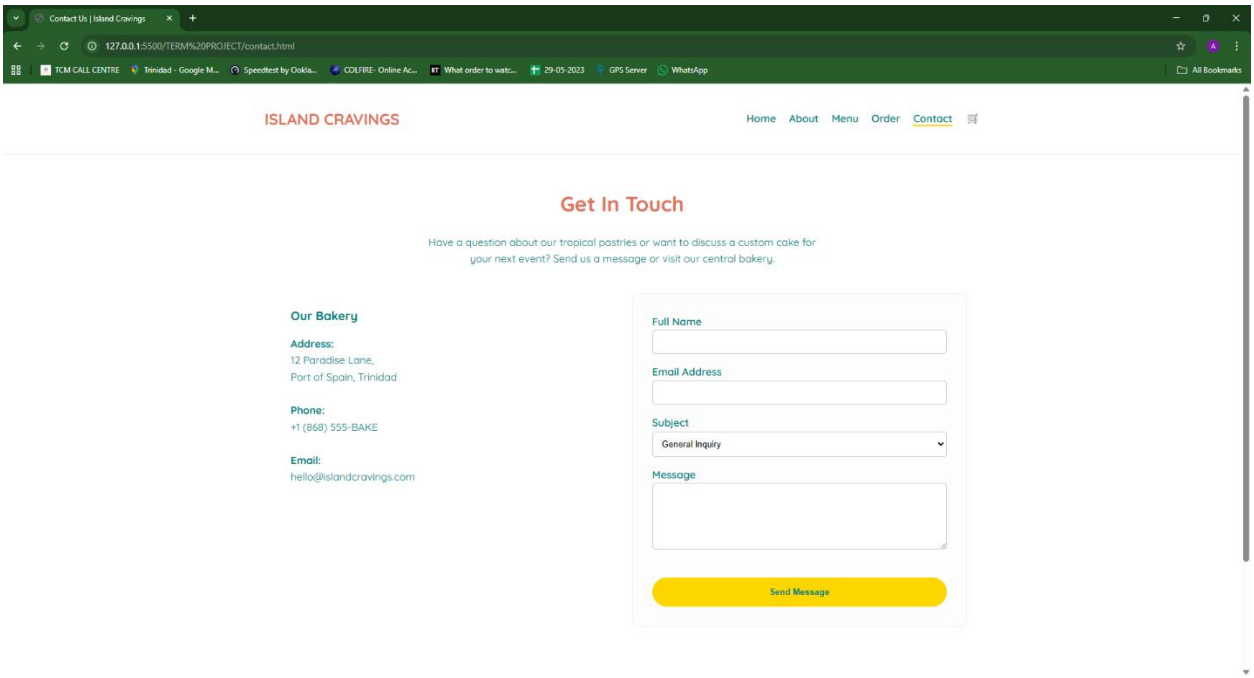

Figure 5: Contact Layout. This page utilizes a two-column grid on desktop views, separating static contact information (address, phone) from the interactive contact form. The footer remains consistent across all pages, featuring the updated Instagram handle and a accessible newsletter sign-up field.
